

The business plan of the Internet service "Intelpet".

The author of the idea: Dmitry Starchikov.

Email: dmstarchikov92@gmail.com.

The latest survey "Euromonitor International" shows that global sales of animal products in 2017 are projected to reach more than 109 billion dollars (99.4 billion euros), thus exceeding the volume of the previous year by 2%.

I propose to create a multilingual international Internet service for people who have pets. The description of the idea is created by the example of dog breeders, but the system can be adapted to any kind of pet or farm animal.

Target audience: pet owners who actively use modern technology and devices. These people are actively using modern technology not just as a means of communication, but as a device that makes life easier.

Product specifics: mass long-term demand, which has no seasonality, the average price segment.

Similar, functioning projects have not been found.

There are no possible biases about the product.

The way services and goods are distributed: direct (possible indirect), retail (possible wholesale sales), possible online sales. Customer searches are done through incoming queries, i.e. through advertising.

Services that a customer can receive.

The set of services available to the customer depends on what type of registration the customer chooses. Therefore, first we will describe the system as a whole, and then we will highlight the unique opportunities for each group of users.

The difference from social networks is that "Intelpet" will focus on pets, not people. But if everything goes as it should, people will have new acquaintances. New relations will be formed in the city or district. Caring for pets will become a common interest. There will also be added functionality and media material to improve the quality of content and parenting of the pet. This will especially help inexperienced owners.

Unlike many pet sites, "Intelpet" will work all over the world. Also, the intelpet project will bring together all the technologies that will help to get a whole new feeling from taking care of the pet.

The service will be used by animal lovers or owners. This is the first kind of customer that is divided into two subspecies.

Such customers "Intelpet" will help to make the care of the pet more understandable, fun, convenient. This will be done with a reference database that is placed directly on the site. You can read about breeds, animal diseases, etc. Pets - are a favorite hobby, the Service will give an opportunity to make the hobby even more modern. It will be possible to combine communication with a living being and modern technologies.

Now to find a couple for your pet you need to spend a small amount of time watching ads in various media. To get real and useful advice on the upbringing and maintenance of a pet you need to spend more than one day.

But in the future, you can go to the site of the project "Intelpet" and find a couple for a pet, useful advice on parenting.

"Intelpet" will speed up the process of finding a pair for an animal, help you educate your pet properly. The owner will not need to spend a lot of time looking for the necessary information.

The owner is registered with a pet or pets. A mobile phone is used when registering.

After registration, the user receives in addition to the page in the system, and also an email address of the kind: login@Intelpet.com. The address will be used for messages from the site system, other users. If you want, you can set up notifications to a regular email account. The service box is created by the machine for the user's convenience. Anyone who may not have an e-mail account at all does not need to provide the main email address. The whole electronic life of the pet will be connected only with this system and mobile number.

Also the box that is created inside the system will be a good protection against spammers. A regular email account can get into the spam database. Inside the system, an optional filter will be set up to accept emails only from the "Intelpet" domain. Even if the spammer is inside the system, it can be stopped by deleting its page. The result will be that users of the system will be able to communicate with each other as comfortably as possible.

But if a user of the system wants to collect all their emails in one unique box, then he can include in the settings the acceptance or sending of the letter from (to) any other address.

I would like to see miniature photos of pets located either around next to the photo of the owner, or under the photo of the owner in the form of an inverted triangle. Miniature photos of pets are smaller than miniature photos of the owner. You can also upload a joint photo if you wish.

The nature of a pet or "Petlist." On the page of each user you will be able to see a brief characteristic of the pet. "Petlist" is actually a user competition. Is the pet masterfully running away from their homes? Prove it with a video or photo and you'll get the "Master of Escape" label in "Petlist!" Did the dog learn the "Sit!" command? Get the tag "I'm sitting, waiting!". For each mark received, we accrue behavioral points. Since negative character traits will show with no eager, for them to give more behavior points. You may not get the mark. For example, for the label "Same to me, a hunter found!" you recorded a video where you with a pet on the hunt. But they showed a hunt in one day. Whoever has made a slicing of the hunting video within a month will get a mark on different days, and you won't. "Petlist" will have to maintain a competitive spirit between the users of the Intelpet system. In addition, experience points will show problem areas in the character of the pet.

Briefly about the search system in the "Intelpet" system. You can choose who to look for, for what purpose, where. For example, a pet needs a pair, or a company for games. That's where "Petlist" and behavior points will help. The first in the results will be those who have the most behavioral points. If two pets have the same number of behavior points, the higher will be the one who has more positive traits. If the pet leads on behavioral points, he will be in the first place and he has more positive features than negative, then in the description of the pet add: "Excellent behavior!". But if he has more negative features than positive ones, the description of the pet will be added with the line: "Rebel!".

Every user of the system will be able to get an electronic assistant. Externally, it should be like an old search assistant from Windows XP. Functional: a calendar with the ability to make reminders for a specific date. For example, you decree in the calendar "26.03.2019: Rex needs to be vaccinated against the plague." On March 26, 2019, you receive a notification from the

system that Rex needs to be vaccinated against the plague. You can choose a simple calendar rather than an animated assistant if you wish. Or install a photo of the pet with which the event is associated.

Today, motorists can mark on the GPS map traffic jams, accidents, etc. Any user of our system will be able to mark on the map veterinary shops, houses with aggressive or friendly dogs, favorite places to walk with a pet, places where it is not desirable to walk with a pet.

Previously, subspecies of ordinary users were mentioned. So, the first subspecies of an ordinary client is a person who just created a profile for using the system for communication.

The second subspecies of the average customer is a person who also registered a profile in the system, but bought a GPS module and an Intelpet collar.

The first commercial benefit and it is the main feature of the project: the sale of collars or GPS module "Intelpet" with the ability to track the basic parameters of the pet and its location. This can be done directly on the site, or with the help of a client program for PCs and mobile devices.

"Intelpet" will be unique in that there is not yet a single international network for communication between owners and their pets, with the opportunity to check how the pet feels at the moment. Do you need to leave home for a while? While you are not at home - go to the site and checked where your pet. It is the ability to check the condition of your pet, will be one of the reasons for frequent use of the service.

Now we will move away from commercial benefits for five minutes. What you want to say about the tracking system: you can note that if your pet is in the area where it should not be, you will receive an alert. There is one "No," the tracking system code will most likely need to be written with 0: you will need to combine tracking and mapping systems to highlight certain areas.

The second commercial benefit: thematic banner advertising on the site. Feed, litter, vets, etc., which brings us to another group of users, which we called "Legal Face".

This type of registration will be an alternative to groups of companies in modern social networks. You can mark yourself on the map of the system, leave contacts, address. It is possible to communicate with past customers, or search for new ones. Such pages can submit an application for their advertising through our system.

The third material benefit: I think such a system should start a channel on YouTube.

Remember "Petlist"? You can make thematic selections and upload videos to the channel. For example, "10 best hunters of the month." Popular Youtube channels bring popularity or money to their creators.

In the future, services are available to the user by subscription to them.

In a separate file, I presented a layout of the user's page.

On the layout of the page I offer an approximate location and design of information about the user and his pet. On the layout of the page are: photos of the user, his pet, information about his pet, a map of the area, calendar, useful links, news feed, advertising, friends. The layout of the page, which I offered, resembles the pages of users in other social networks. In my opinion, this will make the service more attractive to users. The main difference is that thanks to the use of a collar with GPS, the map will be a mark on the location of the pet.

I know that many Google employees have dogs and bring out to the office. I hope to hear from Google employees about my idea.
